## WORKED EXAMPLES 4

## 1-1 MULTIVARIATE TRANSFORMATIONS

Given a collection of variables  $(X_1,...X_k)$  with range  $\mathbb{X}^{(k)}$  and joint pdf  $f_{X_1,...,X_k}$  we can construct the pdf of a transformed set of variables  $(Y_1,...Y_k)$  using the following steps:

1. Write down the set of transformation functions  $g_1, ..., g_k$ 

$$Y_1 = g_1(X_1, ..., X_k)$$
  
 $\vdots$   
 $Y_k = g_k(X_1, ..., X_k)$ 

2. Write down the set of inverse transformation functions  $g_1^{-1}, ..., g_k^{-1}$ 

$$X_1 = g_1^{-1}(Y_1, ..., Y_k)$$
  
 $\vdots$   
 $X_k = g_k^{-1}(Y_1, ..., Y_k)$ 

- 3. Consider the joint range of the new variables,  $\mathbb{Y}^{(k)}$ .
- 4. Compute the Jacobian of the transformation: first form the matrix of partial derivatives

$$D_{y} = \begin{bmatrix} \frac{\partial x_{1}}{\partial y_{1}} & \frac{\partial x_{1}}{\partial y_{2}} & \cdots & \frac{\partial x_{1}}{\partial y_{k}} \\ \frac{\partial x_{2}}{\partial y_{1}} & \frac{\partial x_{2}}{\partial y_{2}} & \cdots & \frac{\partial x_{2}}{\partial y_{k}} \\ \vdots & \vdots & \ddots & \vdots \\ \frac{\partial x_{k}}{\partial y_{1}} & \frac{\partial x_{k}}{\partial y_{2}} & \cdots & \frac{\partial x_{k}}{\partial y_{k}} \end{bmatrix}$$

where, for each (i, j)

$$\frac{\partial x_i}{\partial y_i} = \frac{\partial}{\partial y_i} \left\{ g_i^{-1} \left( y_1, ..., y_k \right) \right\}$$

and then set  $|J(y_1,...,y_k)| = |\det D_y|$ 

Note that

$$\det D_y = \det D_y^T$$

so that an alternative but equivalent Jacobian calculation can be carried out by forming  $D_y^T$ . Note also that

$$|J(y_1,...,y_k)| = \frac{1}{|J(x_1,...,x_k)|}$$

where  $J(x_1,...,x_k)$  is the Jacobian of the transformation regarded in the reverse direction (that is, if we start with  $(Y_1,...,Y_k)$  and transfrom to  $(X_1,...,X_k)$ )

5. Write down the joint pdf of  $(Y_1, ... Y_k)$  as

$$f_{Y_{1},...,Y_{k}}\left(y_{1},...,y_{k}\right)=f_{X_{1},...,X_{k}}\left(g_{1}^{-1}\left(y_{1},...,y_{k}\right),...,g_{k}^{-1}\left(y_{1},...,y_{k}\right)\right)\times\left|J\left(y_{1},...,y_{k}\right)\right|$$
 for  $(y_{1},...,y_{k})\in\mathbb{Y}^{(k)}$ 

**EXAMPLE** Suppose that  $X_1$  and  $X_2$  have joint pdf

$$f_{X_1, X_2}(x_1, x_2) = 2$$
  $0 < x_1 < x_2 < 1$ 

and zero otherwise. Compute the joint pdf of random variables

$$Y_1 = \frac{X_1}{X_2} \qquad Y_2 = X_2$$

## **SOLUTION**

1. Given that  $\mathbb{X}^{(2)} \equiv \{(x_1, x_2) : 0 < x_1 < x_2 < 1\}$  and

$$g_1(t_1, t_2) = \frac{t_1}{t_2}$$
  $g_2(t_1, t_2) = t_2$ 

2. Inverse transformations:

$$\left. \begin{array}{l} Y_1 = X_1/X_2 \\ Y_2 = X_2 \end{array} \right\} \Leftrightarrow \left\{ \begin{array}{l} X_1 = Y_1Y_2 \\ X_2 = Y_2 \end{array} \right.$$

and thus

$$g_1^{-1}(t_1, t_2) = t_1 t_2$$
  $g_2^{-1}(t_1, t_2) = t_2$ 

3. Range: to find  $\mathbb{Y}^{(2)}$  consider point by point transformation from  $\mathbb{X}^{(2)}$  to  $\mathbb{Y}^{(2)}$  For a pair of points  $(x_1, x_2) \in \mathbb{X}^{(2)}$  and  $(y_1, y_2) \in \mathbb{Y}^{(2)}$  linked via the transformation, we have

$$0 < x_1 < x_2 < 1 \Leftrightarrow 0 < y_1 y_2 < y_2 < 1$$

and hence we can extract the inequalities

$$0 < y_2 < 1 \text{ and } 0 < y_1 < 1$$
  $\therefore$   $\mathbb{Y}^{(2)} \equiv (0, 1) \times (0, 1)$ 

4. The Jacobian for points  $(y_1, y_2) \in \mathbb{Y}^{(2)}$  is

$$D_{y} = \begin{bmatrix} \frac{\partial x_{1}}{\partial y_{1}} & \frac{\partial x_{1}}{\partial y_{2}} \\ \frac{\partial x_{2}}{\partial y_{1}} & \frac{\partial x_{2}}{\partial y_{2}} \end{bmatrix} = \begin{bmatrix} y_{2} & y_{1} \\ 0 & 1 \end{bmatrix} \Rightarrow |J(y_{1}, y_{2})| = |\det D_{y}| = |y_{2}| = y_{2}$$

Note that for points  $(x_1, x_2) \in \mathbb{X}^{(2)}$  is

$$D_{x} = \begin{bmatrix} \frac{\partial y_{1}}{\partial x_{1}} & \frac{\partial y_{1}}{\partial x_{2}} \\ \frac{\partial y_{2}}{\partial x_{1}} & \frac{\partial y_{2}}{\partial x_{2}} \end{bmatrix} = \begin{bmatrix} \frac{1}{x_{2}} & \frac{x_{1}}{x_{2}^{2}} \\ 0 & 1 \end{bmatrix} \Rightarrow |J(x_{1}, x_{2})| = |\det D_{x}| = \left| \frac{1}{x_{2}} \right| = \frac{1}{x_{2}}$$

so that

$$|J(y_1, y_2)| = \frac{1}{|J(x_1, x_2)|}$$

5. Finally, we have

$$f_{Y_1,Y_2}(y_1,y_2) = f_{X_1,X_2}(y_1y_2,y_2) \times y_2 = 2y_2$$
  $0 < y_1 < 1, 0 < y_2 < 1$ 

and zero otherwise

**EXAMPLE** Suppose that  $X_1$  and  $X_2$  are independent and identically distributed random variables defined on  $\mathbb{R}^+$  each with pdf of the form

$$f_X(x) = \sqrt{\frac{1}{2\pi x}} \exp\left\{-\frac{x}{2}\right\} \qquad x > 0$$

and zero otherwise. Compute the joint pdf of random variables  $Y_1 = X_1$  and  $Y_2 = X_1 + X_2$ 

## **SOLUTION**

1. Given that  $\mathbb{X}^{(2)} \equiv \{(x_1, x_2) : 0 < x_1, 0 < x_2\}$  and

$$g_1(t_1, t_2) = t_1$$
  $g_2(t_1, t_2) = t_1 + t_2$ 

2. Inverse transformations:

$$Y_1 = X_1 Y_2 = X_1 + X_2$$
  $\Leftrightarrow$   $\begin{cases} X_1 = Y_1 \\ X_2 = Y_2 - Y_1 \end{cases}$ 

and thus

$$g_1^{-1}(t_1, t_2) = t_1$$
  $g_2^{-1}(t_1, t_2) = t_2 - t_1$ 

3. Range: to find  $\mathbb{Y}^{(2)}$  consider point by point transformation from  $\mathbb{X}^{(2)}$  to  $\mathbb{Y}^{(2)}$  For a pair of points  $(x_1, x_2) \in \mathbb{X}^{(2)}$  and  $(y_1, y_2) \in \mathbb{Y}^{(2)}$  linked via the transformation; as both original variables are strictly positive, we can extract the inequalities

$$0 < y_1 < y_2 < \infty$$

4. The Jacobian for points  $(y_1, y_2) \in \mathbb{Y}^{(2)}$  is

$$D_{y} = \begin{bmatrix} \frac{\partial x_{1}}{\partial y_{1}} & \frac{\partial x_{1}}{\partial y_{2}} \\ \frac{\partial x_{2}}{\partial y_{1}} & \frac{\partial x_{2}}{\partial y_{2}} \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ -1 & 1 \end{bmatrix} \Rightarrow |J(y_{1}, y_{2})| = |\det D_{y}| = |1| = 1$$

Note, here,  $J(x_1, x_2) = |\det D_x| = 1$  also so that again

$$|J(y_1, y_2)| = \frac{1}{|J(x_1, x_2)|}$$

5. Finally, we have for  $0 < y_1 < y_2 < \infty$ 

$$f_{Y_1,Y_2}(y_1, y_2) = f_{X_1,X_2}(y_1, y_2 - y_1) \times 1 = f_{X_1}(y_1) \times f_{X_2}(y_2 - y_1) \quad \text{by independence}$$

$$= \sqrt{\frac{1}{2\pi y_1}} \exp\left\{-\frac{y_1}{2}\right\} \sqrt{\frac{1}{2\pi (y_2 - y_1)}} \exp\left\{-\frac{(y_2 - y_1)}{2}\right\}$$

$$= \frac{1}{2\pi} \frac{1}{\sqrt{y_1 (y_2 - y_1)}} \exp\left\{-\frac{y_2}{2}\right\}$$

and zero otherwise

Here, for  $y_2 > 0$ 

$$f_{Y_2}(y_2) = \int f_{Y_1,Y_2}(y_1, y_2) \, dy_1 = \int_0^{y_2} \frac{1}{2\pi} \frac{1}{\sqrt{y_1(y_2 - y_1)}} \exp\left\{-\frac{y_2}{2}\right\} \, dy_1$$

$$= \frac{1}{2\pi} \exp\left\{-\frac{y_2}{2}\right\} \int_0^{y_2} \frac{1}{\sqrt{y_1(y_2 - y_1)}} \, dy_1$$

$$= \frac{1}{2\pi} \exp\left\{-\frac{y_2}{2}\right\} \int_0^1 \frac{1}{\sqrt{ty_2(y_2 - ty_2)}} \, y_2 dt \qquad \text{setting } y_1 = ty_2$$

$$= \frac{1}{2\pi} \exp\left\{-\frac{y_2}{2}\right\} \int_0^1 \frac{1}{\sqrt{t(1 - t)}} \, dt$$

$$= \frac{1}{2} \exp\left\{-\frac{y_2}{2}\right\}$$

as (by MAPLE, or further transformations)

$$\int_{0}^{1} \frac{1}{\sqrt{t(1-t)}} dt = \pi$$
